Precision Endoscopic Technologies LLC has designed the first and only “through the scope” infrared device to treat internal hemorrhoids under direct visualization safely and effectively.

Why the Precision Infrared Coagulator (PIRC)?

For the Patient...
- Hemorrhoids are painful and uncomfortable and may lead to more serious medical issues
- PIRC is less painful than other non-light based therapies
- PIRC is a quick procedure and the patient can resume their normal routine immediately

For the Physician...
- The PIRC procedure uses the proven efficacy of infrared coagulation
- The PIRC procedure is done through the scope allowing for immediate visual confirmation and pinpoint accuracy
- The PIRC procedure is simple and fast with minimal complications
- The PIRC procedure is as clinically effective as other therapies*

For the Practice...
- 50% of patients suffer from hemorrhoids
- Building your hemorrhoid treatment program will draw incremental patients into your practice
- The PIRC procedure is reimbursable using existing CPT codes
- Expanding your hemorrhoid treatment program will drive other services (i.e. colonoscopy/sigmoidoscopy/and other diagnostic and therapeutic procedures)

* Novel Endoscopic Delivery Modality of Infrared Coagulation Therapy for Internal Hemorrhoids. Elisabeth C. McLemore, MD. Published in “Surgical Endoscopy” April 2012

How is the PIRC Procedure performed?
- A standard colonoscopy or sigmoidoscopy is performed.
- A single-use, disposable probe is advanced through the endoscope until the distal tip appears.
- The scope is then retroflexed and the probe is advanced until contact is made with the tissue.
- Treatment pulses are applied to the base of the hemorrhoid just above the dentate line.
